

Variables and Data Types

* Variables $\Rightarrow$ contains which stores value.

How to create?

Syntax:

"var_name" = "value"

* A variable is created the moment you assign a value to it

eg:

x = 5, y = "John"

Rules for naming variables:

- i. Can contain letters, numbers, underscore
- ii. cannot start with number
- iii. case sensitive
- iv. cannot use python keywords

$\Rightarrow$ Datatypes

* represents the type of data stored in a particular variable

built-in data types

- i. text type : str
- ii. numeric types : int, float, complex
- iii. Sequence types : list, tuple, range
- iv. Mapping type : dict
- v. set types : set, frozenset
- vi. boolean type : bool
- vii. binary type : bytes, bytearray, memoryview
- viii. None type : NoneType

⇒ type(var) is used, if you want to know the type of data stored in variable.

Quiz:

1. Create a variable

⇒ print it

⇒ print it's type.
