

Input Function and Type Casting

⇒ input():

* input() is used to take input from the user

Syntax:

var = input("Prompt")

* input() always returns string { type(var) }

* "Even if user enters number, it will be stored as string."

⇒ type casting:

* type casting means converting one data type into another

i. int() ⇒ converts variables to integer variable

eg: 10.5 ⇒ 10

ii. float() ⇒ converts into floating variable

eg: 9 ⇒ 9.0

iii. str() ⇒ converts into string.

eg: 65 ⇒ "65"

common error while type casting

- i. invalid conversion
- ii. forgetting conversing

Quiz:

1. What does `input()` return?
2. Why do we use `int()`?
3. What happens if we add two strings containing numbers?
