

## Python Tuples:

A tuple is a collection of items which is

- ordered
- immutable (can't be changed)
- allows duplicate values

### i. Creating a tuple

Syntax

`t = (ele, ele, ele)`

### ii. Single element tuple

Syntax

`t = (ele,)`

# comma is important, otherwise it is treated as integer

### iii. Tuple Methods

#### 1. `count()`

→ count how many times an element is repeated

#### 2. `index()`

→ return index of an element

3. list()

→ convert tuple into list

iv. looping through tuple

→ helps to iterate tuple

Note:

\* Use when data should not change

Assignment

1. Create a tuple and print element

2. count Occurrence of a value

3. Modify tuple
